Apollo Connected - Consolidated Deployment

IT instructions | 22 September 2026

This is a full merged source package based on the latest IT live ZIP. Existing live modules are preserved; the package adds the finalized AI security, Microsoft Graph noreply email, and Kuwait Customer Compliance/Apollo Shield work.

1. Deploy the full source

Use the supplied full ZIP as the new deployment source and follow the normal Cloud Run build/deploy process.

Do not run the complete historical migration chain. Apply only the new Customer Compliance migration:

```
server/sql/042_customer_compliance.sql
```

Migration 041 is already used by the current IT live build for AWB branch sequencing. Chat remains migration 040.

2. Microsoft Graph shipment updates (noreply)

Shipment status emails now send centrally from the configured noreply mailbox. SMTP AUTH is not required for this feature.

Cloud Run variable	Value
MAIL_SEND_ENABLED	true
MAIL_PROVIDER	microsoft_graph
M365_TENANT_ID	Microsoft 365 tenant ID
M365_CLIENT_ID	Apollo Connected app/client ID
M365_CLIENT_SECRET	Map from Google Secret Manager
MAIL_FROM	noreply@apollo-freight.com
MAIL_GRAPH_TIMEOUT_MS	15000

For mailbox-only security, configure Exchange Online Application RBAC with Application Mail.Send scoped only to noreply@apollo-freight.com. Do not leave a separate unscoped tenant-wide Entra Mail.Send grant on the same app.

```
New-ServicePrincipal -AppId <CLIENT_ID> -ObjectId <SERVICE_PRINCIPAL_OBJECT_ID> -DisplayName
"Apollo Connected Mail"
```

```
New-ManagementScope -Name "ApolloConnected-Noreply" -RecipientRestrictionFilter
"PrimarySmtpAddress -eq 'noreply@apollo-freight.com'"
```

```
New-ManagementRoleAssignment -Name "ApolloConnected-Noreply-MailSend" -App
<SERVICE_PRINCIPAL_OBJECT_ID> -Role "Application Mail.Send" -CustomResourceScope
"ApolloConnected-Noreply"
```

```
Test-ServicePrincipalAuthorization -Identity <SERVICE_PRINCIPAL_OBJECT_ID> -Resource
noreply@apollo-freight.com
```

3. Customer Portal - Kuwait Compliance / Apollo Shield

The Kuwait HS master is already inside the package. Customer documents are analyzed through Vertex AI, then HS code/description validation is performed against the local Kuwait master. Connected only displays lines that need attention and never replaces a customer HS code automatically.

Enable Vertex AI for the Google Cloud project and allow the Cloud Run runtime service account to call Vertex AI (for example, grant Vertex AI User). Set:

```
APOLLO_COMPLIANCE_PROVIDER=vertex
APOLLO_COMPLIANCE_LOCATION=global
APOLLO_COMPLIANCE_MODEL=gemini-3.1-flash-lite
```

Existing Apollo AI can keep its current Gemini configuration. Customer commercial documents use the Vertex path by default.

4. AI security included

User type	Apollo AI access
Admin	Cross-user / cross-branch Operations + full authorized CRM
Operations	Own shipment entries only, within permitted branch
Sales / CRM	CRM only; assigned CRM accounts only; no Operations browsing

5. Live verification after deploy

1. Admin AI: ask for Dubai shipments created by another user and confirm authorized results are returned.

2. Sales/CRM login: ask "show me today's shipments" - Operations data must not be returned; CRM queries must show assigned accounts only.

3. Shipment update: send one update and confirm the email arrives from noreply@apollo-freight.com.

4. Customer Portal: upload a Kuwait invoice/packing list, run HS check, confirm only exceptions are shown, and test one suggested HS acceptance.

5. Confirm Apollo Shield appears only when every line passes and that extracted pieces/weight/dimensions/CBM populate the shipment request.

If any Graph 401/403, Vertex 403/404, or database error appears, stop changing permissions/settings and capture the exact Cloud Run log entry first.

Release contents: AI V6 + security hardening, Connected Chat preserved, Microsoft Graph noreply mail, Kuwait HS Compliance/Apollo Shield, shipment detail extraction, and all existing IT live changes.
